5. Releasable chicken loop

Safety system

6. Red plastic part
7. Black bottom part
8. Safety line
9. Metal end loop
10. Safety leash

CRAZYFLY

SAFETY SYSTEM

These steps clearly explain you how the push away safety system works. It is simple and safe. Follow these steps every time before riding, because the safety system can get worn out and may not work properly. So before every riding sessions, check carefully if the safety system is working.

1. Always attach your kite with your safety leash to your harness.

2. In case of emergency, simply push away red plastic part of quick release with CF logo.

3. This releases the metal end loop of chicken loop.

4. Now the chicken loop is opened. This kills rapidly the power of the kite. You are now connected to the kite only via the safety leash, which should also be releasable in a case of extreme emergency.

5. To re-assemble the safety system, hold the black bottom part of quick release in your left hand and push the metal end of chicken loop by your right hand to the hole in quick release.

6. This opens the red part of quick release and click automaticaly. Now the quick release safety system is ready to use again.

Make sure that there is no sand or dirt inside the safety system.
Rinse the safety system with clean water after every ride if possible.
